

## The COVID-19 Hoax

### Description

### The COVID-19 Hoax.

COVID-19 = SARS 2 = SARS-CoV-2.

SARS is an acronym for “Severe Acute Respiratory Syndrome”.

The SARS 1 = SARS-CoV-1 = SARS-CoV virus was responsible for the 2003 SARS epidemic in China/Asia.

The COVID-19 virus was initially called the SARS-CoV-2 virus because genetically it is almost the same as the more deadly SARS, or SARS-CoV-1, virus. However, the name was changed because it was not wanted that the general population associate the two. Well, technically the name of the virus was not changed, they just changed the name of the disease to COVID-19 while leaving the name of the virus as SARS-CoV-2.

The SARS-CoV-1 virus (9–11% mortality) is much more deadly than COVID-19 (the mortality is debated, perhaps 1-3%) but did not spread much beyond Asia before it died out.

To throw the whole COVID-19 epidemic into perspective it should be emphasized that every year there are between 294,000 and 518,000 deaths from influenza. You can read about this here:

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC6815659/pdf/jogh-09-020421.pdf>

300,000 to 500,000 dead every year.

300,000 dead in a good flu season.

500,000 dead in a bad flu season.

You may ask why there is no global lock-down for influenza.

You may ask why the media shows no concern at all for the hundreds of thousands of mainly elderly people who die due to this on-going influenza epidemic.

[nextstrain.org](https://nextstrain.org)

There is a lot of interesting information on various epidemics at <https://nextstrain.org/ncov>

Have a look.

However, there are a few reasons to worry about [nextstrain.org](https://nextstrain.org)’s reporting of the COVID-19 epidemic.

- 1) They do not include any RNA sequences of the Iranian strains of COVID-19.
- 2) They do not include any data at all on SARS-CoV-1.
- 3) They have removed/hidden the data points from the ship Diamond Princess (which showed that the COVID-19 variety on the ship was American).
- 4) On March 29 the number of sequenced RNA sequences went down which seemed strange. This was achieved by the date range being set differently. First the end date was set March 25 (instead of March 29) and an hour or two later it was set to March 27, so that the latest data is hidden. Perhaps someone is embarrassed that the evidence does not support the media's (clearly wrong) story.
- 5) March 30: It is notable that they have finally got around to adding Iran to their list of countries, but have not as yet added any Iranian data.
- 6) April 2: The end date is still set to March 29, although the total varieties/genomes is now 2629. Still no Iranian data.

Note: RNA is like DNA. It is the genetic code of the virus.

The lack of Iranian strains at [nextstrain.org](https://nextstrain.org) is possibly because the Iranian strain is quite different, and this would indicate that a more lethal variety of the virus had been deliberately released in Iran. In fact, [nextstrain.org](https://nextstrain.org) may have been set up with the intention of hiding the fact that the Iranian variety is noticeably different (like some have claimed). The reason that such a scheme would work is that people would naturally believe; "The Iranian variety cannot be too different, otherwise experts would have pointed this out, and the evidence would have been reported at [nextstrain.org](https://nextstrain.org)."

The lack of data concerning SARS-CoV-1 may be due to the SARS-CoV-1 virus giving a positive for COVID-19. And this would bring into question the results of the COVID-19 testing.

The data from [nextstrain.org](https://nextstrain.org)

The March 28 2020 data shows the existence of 2084 different varieties of COVID-19 worldwide. It also shows the existence of 341 different varieties of COVID-19 in Iceland.

The 341 varieties/genomes from Iceland prove that the virus already existed in Iceland prior to Wuhan.

The 2084 varieties/genomes worldwide prove that the virus already existed worldwide prior to Wuhan.

So, COVID-19 existed last year, and the year before, and the year before,...

People have probably been getting sick from various varieties of Covid-19 for decades.

Possibly, people have been dying of various varieties of Covid-19 for decades, only in the past it was called, the flu, or pneumonia, or similar. Since, sequencing of the RNA was not done, and tests for the Covid-19 strain did not exist, no one knew it was Covid-19.

The current "theory" is that all Covid-19 varieties/genomes emerged from one that "appeared" in Wuhan in December 2019. That is, all the 2084 Covid-19 varieties mutated from an original Wuhan virus.

This hypothesis means that all the 2084 Covid-19 varieties have developed within the last four months.

But this is an unheard of and impossibly high rate of evolution.

The fact that the virus already existed previous to Wuhan is also suggested by various people who are unlikely to have been in recent contact with the virus, e.g., Boris Johnston, Rand Paul, Prince Charles, etc, testing positive. And by the many people who test positive, but have absolutely no recollection of the disease (because they had it years ago).

The Covid-19 test looks for antibodies that the body has used to fight the disease. It does not tell how long ago the disease occurred. The assumption is that it **MUST BE** very recent. But that is only because “everyone” believes that everything started with Wuhan, which it didn’t.

The deliberate spreading of the virus was probably only to China, Iran, and Italy, where more virulent strains were released.

Train travel tells a story about COVID-19.

It is obvious that the story we are being told about the COVID-19 epidemic is very wrong.

Everyday 34 trains leave Wuhan for Shanghai.

These trains usually carry 600 or 1200 passengers.

Let us assume that only 50 passengers on each train travel from Wuhan to Shanghai.

For simplicity, we assume this whether the trains carry 600 or 1200 passengers.

So every day  $34 * 50 = 1,700$  people from Wuhan go to Shanghai.

The virus circulated in Wuhan for roughly 40 days before the authorities took action.

Therefore  $34 * 50 * 40 = 68,000$  people from Wuhan end up in Shanghai.

These 68,000 + those arriving by plane + those arriving by automobile, result in 353 confirmed cases of Covid19.

More than 68,000 Chinese from Wuhan visit Shanghai resulting in 353 cases of Covid19.

Everyday 35 trains leave Wuhan for Beijing.

These trains usually carry 600 or 1200 passengers.

Let us assume that only 50 passengers on each train travel from Wuhan to Beijing.

For simplicity, we assume this whether the trains carry 600 or 1200 passengers.

So every day  $35 * 50 = 1,750$  people from Wuhan go to Beijing.

The virus circulated in Wuhan for roughly 40 days before the authorities took action.

Therefore  $35 * 50 * 40 = 70,000$  people from Wuhan end up in Beijing.

These 70,000 + those arriving by plane + those arriving by automobile, result in 442 confirmed cases of Covid19.

More than 70,000 Chinese from Wuhan visit Beijing resulting in 442 cases of Covid19.

Everyday 37 trains leave Wuhan for Chongqing.

These trains usually carry 600 or 1200 passengers.

Let us assume that only 50 passengers on each train travel from Wuhan to Chongqing.

For simplicity, we assume this whether the trains carry 600 or 1200 passengers.

So every day  $37 * 50 = 1,850$  people from Wuhan go to Chongqing.

The virus circulated in Wuhan for roughly 40 days before the authorities took action.  
 Therefore  $37 * 50 * 40 = 74,000$  people from Wuhan end up in Chongqing.  
 These 74,000 + those arriving by plane + those arriving by automobile, result in 576 confirmed cases of Covid19.

More than 74,000 Chinese from Wuhan visit Chongqing resulting in 576 cases of Covid19.

Everyday 84 trains leave Wuhan for Guangzhou.  
 These trains usually carry 600 or 1200 passengers.  
 Let us assume that only 50 passengers on each train travel from Wuhan to Guangzhou.  
 For simplicity, we assume this whether the trains carry 600 or 1200 passengers.  
 So every day  $84 * 50 = 4,200$  people from Wuhan go to Guangzhou.  
 The virus circulated in Wuhan for roughly 40 days before the authorities took action.  
 Therefore  $84 * 50 * 40 = 168,000$  people from Wuhan end up in Guangzhou.  
 These 168,000 + those arriving by plane + those arriving by automobile, result in 1,357 confirmed cases of Covid19.

More than 168,000 Chinese from Wuhan visit Guangzhou resulting in 1,357 cases of Covid19.

Over the same time period, less than 1000 Chinese from Wuhan arrive in Iran.  
 These are supposedly responsible for 12,729 confirmed cases by March 16.

Less than 1,000 Chinese from Wuhan visit Iran resulting in 12,729 confirmed cases.

Over the same time period, less than 1000 Chinese from Wuhan arrive in Italy.  
 These are supposedly responsible for 21,157 confirmed cases by March 16.

Less than 1,000 Chinese from Wuhan visit Italy resulting in 21,157 confirmed cases.

What I know is that the number of one-way tickets from Wuhan to Paris in the first quarter 2019 was 4,232.

Using this 90 day period as a proxy, this is  $4,232 * 4/9 = 1,880$  passengers for the 40 day period of interest.

Also known is that the number of passengers to Iran or Italy was less than those to Paris

The guess of 1,000 passengers from Wuhan to Italy & Iran is a guess based on this (1,880 figure).

It is an educated guess.

Gathering the summaries together we have:

CODE: [SELECT ALL](#) More than 68,000 Chinese from Wuhan visit Shanghai resulting in 353 confirmed cases.  
 More than 70,000 Chinese from Wuhan visit Beijing resulting in 442 confirmed cases.  
 More than 74,000 Chinese from Wuhan visit Chongqing resulting in 576 confirmed cases.  
 More than 168,000 Chinese from Wuhan visit Guangzhou resulting in 1,357 confirmed cases.  
 Less than 1,000 Chinese from Wuhan visit Iran resulting in 12,729

confirmed cases.

Less than 1,000 Chinese from Wuhan visit Italy resulting in 21,157 confirmed cases.

The confirmed cases are those reported on March 16, 2020.

How is it visitors from Wuhan to major Chinese cities have an almost zero transmission rate?

Yet we are told that visitors from Wuhan to foreign countries have a very high transmission rate.

How can this be?

Wuhan is in the middle of China.

How could the disease bypass all the major Chinese cities and massively infect huge numbers in foreign countries?

Why didn't the disease infect large numbers in the major Chinese cities?

Conclusion: The story we are being told about Covid-19 = SARS-CoV-2 is a big lie.

Plane travel tells the same story as train travel.

We use the one-way bookings from Wuhan to various countries in the first quarter of 2019 to estimate the number of airline passengers. The top ten destinations from Wuhan were:

CODE: [SELECT ALL](#) Thailand 74,185

Japan 29,710

Taiwan 25,752

Hong Kong 21,852

Malaysia 19,105

Korea 18,623

Australia 15,020

Cambodia 13,456

USA 13,267

Singapore 12,959

Note that neither Iran or Italy are in the top ten destinations.

We are interested in 40 days from the 90 day period, so we multiply by 4/9. We have:

CODE: [SELECT ALL](#) More than 32,971 Chinese from Wuhan visit Thailand resulting in 827 confirmed cases of Covid19.

More than 13,204 Chinese from Wuhan visit Japan resulting in 1,140 confirmed cases of Covid19.

More than 11,445 Chinese from Wuhan visit Taiwan resulting in 215 confirmed cases of Covid19.

More than 9,712 Chinese from Wuhan visit Hong Kong resulting in 386 confirmed cases of Covid19.

More than 8,491 Chinese from Wuhan visit Malaysia resulting in 1,624 confirmed cases of Covid19.

More than 8,277 Chinese from Wuhan visit Korea resulting in 9,037 confirmed cases of Covid19.

More than 6,675 Chinese from Wuhan visit Australia resulting in 2,044

confirmed cases of Covid19.

More than 5,980 Chinese from Wuhan visit Cambodia resulting in 87 confirmed cases of Covid19.

More than 5,896 Chinese from Wuhan visit USA resulting in 46,450 confirmed cases of Covid19.

More than 5,759 Chinese from Wuhan visit Singapore resulting in 509 confirmed cases of Covid19.

The source of this information is the OAG (Air Travel Intelligence) Traffic Analyzer.

Conclusion: The virus was deliberately spread to certain areas. Other areas were forgotten about.
