

England: 62% of “COVID” Deaths Are the Vaccinated

Description

via: [The Daily Expose](#)

Breaking news on the morning of Friday June 25th revealed Matt Hancock has been having a secret affair with his aide Gina Coladangelo. We imagine it's all the nation has been talking about since the images of Hancock embracing the millionaire lobbyist were published, it's certainly all over the mainstream media and we doubt it will cease to be front page news any time soon.

But because you've been busy delighting in Hancock's embarrassment, **you're probably not aware that Public Health England released a report on the very same day which showed the majority of alleged Covid-19 deaths are significantly higher in people who have had at least one dose of the Covid-19 vaccine, with the highest number of deaths occurring in people who are supposed to be fully vaccinated.**

The report titled '[SARS-CoV-2 variants of concern and variants under investigation in England](#)', is the 17th technical briefing on alleged variants of concern in the United Kingdom and makes for extremely interesting reading once you realise what the statistics are actually telling us.

PHE have compiled a helpful table which shows the number of alleged confirmed Delta variant cases in the UK alongside the number of alleged deaths due to the variant. The table shows that since the 1st February 2021 up to the 21st June 2021 there have been 9,571 alleged confirmed cases of the Delta variant in people over the age of 50. Of these 8,025 had been confirmed in the past 28 days alone.

But the data shows that people over the age of 50 who are unvaccinated account for just 10% of the alleged confirmed Covid cases, whilst those who are fully vaccinated account for 37% of the alleged confirmed cases. A further 40% of the alleged cases are people who had received one dose of a Covid-19 vaccine at least 21 days prior to their alleged confirmed Covid-19 infection.

Image not found or type unknown

As you can see from the above table the number of people over 50 who are fully vaccinated with an alleged confirmed case of the Delta variant outnumber those who are unvaccinated by 3 to 1, whilst the number of people over 50 who have had at least one dose of the Covid jab and have an alleged confirmed case of the Delta variant outnumber those who are unvaccinated by nearly 9 to 1.

When the Covid-19 vaccines were given emergency use authorisation the authorities did not have a clue as to whether they would work. The limited trials carried out only measured whether or not a vaccinated person suffered serious disease if infected with Covid-19, they did not measure whether a vaccinated person could still become infected with Covid-19, and they did not measure whether or not a vaccinated person could still spread the virus in line with the [mainstream accepted germ theory](#).

It is claimed that the vaccines reduce the chances of suffering serious illness if infected with Covid-19 significantly, so although a significantly higher amount of vaccinated over 50's have a confirmed case

of the Delta variant compared to those who are unvaccinated, you would assume that the opposite would be seen in the number of people who have allegedly died to the Delta variant?

Because Mr Hancock has told us time and time again that the Covid-19 vaccines are our only route back to normal and we must come forward, roll up our sleeves and get the jab when called upon to do so. So the vaccines must surely do what they say on the tin? It's not as if Mr Hancock would lie to us, is it? He might have lied to his wife of fifteen years and engaged in an affair with an aide who he appointed to scrutinise the Department of Health as well as awarding her Taxpayers money for doing so, but he wouldn't lie to the British people, would he?

Unfortunately, it looks like Mr Hancock has been lying again and instead of the Covid-19 vaccines being our route back to normal they are instead quite the opposite. Because the data published by Public Health England shows us that the number of alleged deaths due to the Delta variant are highest among those who have received two doses of the vaccine. [That's only true in the absolute.]

Image not found or type unknown

Of the 117 alleged Covid deaths to have occurred since the 1st February, a huge 60% of them were people who had received at least one dose of a Covid-19 vaccine which is allegedly supposed to protect them from serious illness. But the majority were not people who had only received one dose, 70% of those who had died even after at least one dose of the Covid-19 jab were in fact fully vaccinated, and a further 27% of those who'd had at least one dose had received their first dose at least 21 days prior to their death.

The number of unvaccinated people to have allegedly died of the Delta variant accounted for just 37% of all alleged Covid deaths according to PHE data.

PHE also revealed just how frighteningly dangerous the Delta variant is within their report. Table 2 shows us that the case fatality rate for the Delta variant is an astronomical 0.1%.

Image not found or type unknown

We wonder if you were surprised as we were to see a fatality rate as low as 0.1%? Maybe it's a mistake, because the people who religiously watch BBC news, trust the Government, and the WHO, wear a mask religiously, preach to others that there's nothing to worry about when it comes to taking an experimental vaccine because "science is just quicker now", and attempt to coerce others into

getting the jab because “the delta variant is really dangerous”, can’t all be wrong, can they?
