## Criminal Fraud on Covid Deaths

### Description

Some data from the UK.

– Comparing the death rate of 2020 with previous 20 years.

2020 rate was 1,037/100,000 in the UK. Highest in 10 years but not the highest in the last 20 years.

What happened?

2008 had a death rate of 1,084/100,000.

2005 had 1,137/100,000.

**Every year prior to 2009 had a higher death rate than 2020.**

– UK Lockdown was towards end of March in 2020;

– At home deaths began to escalate in April.

5 year avg. for deaths in April previous to 2020 was 9,384. In April 2020 there were 16,909 at home deaths;

5 year average for deaths in care homes in April was 8,691. In April 2020 there were 26,541 deaths that occurred in care homes. An astronomical increase.

Hospital data for April 2017- 2020:

April-June 2017– 91,724 beds occupied= 89% occupancy rate;

April-June 2018– 91,056 beds occupied= 90% occupancy rate;

April-June 2019– 91,730 beds occupied= 90% occupancy rate;

April-June 2020 58,005 beds occupied= 62% occupancy rate.

2018 – April – 1,984,369 attended A&E (Ambulance and Emergency)

2019 – April – 2,112,165 attended A&E

2020 – April – 916,581 attended A&E

Important Notes:

30% less hospital beds occupied in April – June 2020 compared with previous 3 years.

---

A&E in April 2020 was 57% down from 2019.

These numbers explain the high numbers of at home deaths.

Increase in deaths occurring at home and in care homes in April 2020 due to not being treated for illnesses in hospital. No acute care in private homes or care homes.

**CAUSE OF DEATHS USING DECEMBER 2020 AS EXAMPLE:**

– Leading cause of death was stated as “Covid-19 deaths”- 10,973 deaths for December 2020.

– 2nd leading cause of death in December 2020- Dementia and Alzheimer’s- 5281 deaths.

Previous 5 year average for December- 28,198 deaths due to Dementia and Alzheimer’s.

This is a 500%+ alteration from previous 5 years. A statistical impossibility.

– Heart disease deaths in December 2020- 4,635 deaths.

December 5 year average- 21,997 deaths.

**This represents a near 500% statistical deviation from previous 5 year average- also not possible.**

– Chronic lower respiratory disease deaths December 2020- 1,790 deaths.

December 5 year average- 13,384 deaths.

**This represents about a 700% detour from the 5 year average. Not possible.**

– Influenza and pneumonia deaths in December 2020- 1,190 deaths.

December 5 year average- 11,295 deaths.

**This represents about a 1000% deviation from the 5 year average.**

What is left to say?

It seems it would take quite a monumental argument to prove that the death certificates have not been manipulated. It would take an even grander argument to illustrate that the NHS was under pressure at any time as during the height of the “pandemic” at home deaths soared to record heights and hospital and emergency services sunk to all-time lows.

How is this not criminal fraud that resulted in numerous premature and unnecessary deaths?
