Amazon's Bezos Predicts Only Limited Number of People Will Get to Remain on Earth

Description

Humanity will move most industry into space and allow only a select few to remain on our planet, which will be turned into a natural resort, according to self-funded space explorer Jeff Bezos.

The Amazon billionaire enthusiastically shared his predictions for what human civilization will look like in the future – with him personally helping to bring that future closer – during a <u>talk</u> at the annual Ignatius Forum in Washington, DC.

He expects vast cylindrical space colonies spinning to create artificial gravity for millions of residents to take over most industrial production. Meanwhile, Earth will be turned into a natural reserve with restricted access similar to US national parks today.

"This place is special, we can't ruin it," the founder of Amazon said of our planet.

"Millions of people will move from Earth to space over time. And that's the vision of Blue Origin – millions of people working in space," he said, referring to his own firm.

"Over centuries, most or many of the people will be born in space. It will be their first home. They will be born on these colonies, they will live on these colonies. They may visit Earth the way you would visit Yellowstone National Park," Bezos predicted.

He said that the colonies themselves "will have rivers and forests and wildlife," which arguably brought his speech out of the realm of futurology and towards optimistic science fiction. Amazon is infamously resourceful when it comes to squeezing its workers for every drop of productivity. That's why the similarly rosy description of 'Amazon factory towns' solving economic inequality in the US was met with horror, when it was proposed by a Bloomberg columnist in September.

Bezos referred to Princeton physicist Gerard O'Neill, who proposed the concept of space habitats in 1976, as the source of inspiration for him. He said the sort of expansion he predicted was inevitable, if humanity is to grow in a sustainable way.

"This Earth can support, let's say, 10 billion people to a certain degree. We'd have to work really hard to figure out how to do that without degrading the planet... The solar system can support a trillion people," he said.

The entrepreneur didn't comment on who he thinks would decide who gets to live on Earth in the future, when asked by the host of the event, Adi Ignatius. If historic precedent is any indicator, privileges granted by wealth and status may be involved.

The perks of Bezos' own status as one of the richest people on Earth were discussed in the interview, when Bezos bragged about managing to get a cameo in his favorite movie franchise, Star Trek.

"That was not an easy gig to get," he said of his appearance in the 2006 feature film 'Star Trek: Beyond'. "I insisted on a speaking role, which complicated the whole scenario," he said.

In the movie, Bezos wore alien prosthetics and had one line: "Speak normally." He said he "nailed it," prompting laughter from the audience.

Talking about Blue Origin, the billionaire compared his firm to barnstormers from the early days of

aviation. He said taking rich tourists on suborbital flights will turn them into "Earth ambassadors," who would advocate for increasing space exploration in the name of protecting our planet. This will give more resources to making manned space travel routine, similar to how biplanes of old evolved into the passenger airliners of today, he said.

"The hard part is not space travel – that part was solved in the 1960s. Not reusability – the space shuttle sort of did that. The hard part is operational reusability," he said. "It requires practice to get it right."
