Pills with digital sensors are now the latest controversial technology that has seen itself gain approval from the FDA. The alarming new devices would employ a set of sensors within the chips to track data regarding each patients.

It has been revealed that the FDA has authorized an Orwellian medical device that utilizes sensors implanted into tablets to digitally monitor medicine intake in patients' bodies.

The US Food and Treatment Administration [bragged](#) in a recently released press statement from December 2017 regarding certifying an unique medication with a "digital ingestion tracking system" that employs "sensors" within pills to interact with a mobile device to document if and when the patient ingested the medicines.

"The system works by sending a message from the pill's sensor to a wearable patch," according to a press release.

"The patch transmits the information to a mobile application so that patients can track the ingestion of the medication on their smart phone. Patients can also permit their caregivers and physician to access the information through a web-based portal."

Abilify, an antipsychotic medicine utilized to treat major psychiatric diseases such schizophrenia and bipolar driven mania, has been authorized to use this technology. Nonetheless, the FDA cleared the application of the "ingestible sensor" in 2012, indicating that the innovation could be utilized more broadly in the future.

"Being able to track ingestion of medications prescribed for mental illness may be useful for some patients," said Mitchell Mathis, M.D., director of the Division of Psychiatry Products in the FDA's Center for Drug Evaluation and Research.

"The FDA supports the development and use of new technology in prescription drugs and is committed to working with companies to understand how technology might benefit patients and prescribers."

It is hardly contentious to use medicine to ensure that individuals who may be a hazard to oneself or others are cared for properly. Those opposed to the existing COVID-19 vaccine regulations, on the other hand, will be concerned about whatever technology that could aid in the continuation of medical dictatorship.

"The deaths that are meant to follow the vaccinations will never be able to be pinned on the poison. They will be too diverse, there will be too many, and they will be in too broad a timeframe for us to understand that we have been poisoned," claims Dr. Shankara Chetty.
