

Russian MoD Presents New Documents on Dozens of Pentagon-Backed Bioweapons Projects in Ukraine and Nigeria

Description

via @sputniknewsus

Official documents have been published by the Russian MoD confirming that the US Department of Defence Threat Reduction Agency (DTRA) is working in Ukraine with a specific military-biological focus:

?The memorandum regarding the UP-2 project was prepared by the office of the US Secretary of Defence: according to the document, the mapping of especially dangerous pathogens in Ukraine should have been held;

?The document notes that the main task of this project is to collect information on the molecular composition of pathogens that are typical in Ukraine and to transfer samples of strains;

?A similar memorandum was prepared as part of the UP-1 project, aimed at studying rickettsia and other diseases spread by arthropods. The document noted the need to transfer all collections of especially dangerous pathogens to the central reference laboratory, which would make it possible to facilitate the process of exporting them to the United States;

?The large-scale UP-4 project was carried out to study the possibility of spreading especially dangerous infections through migratory birds. The documents show that for the period from November 2019 to January 2020, 991 biological samples were collected;

?There is information about the implementation of 10 such projects (including UP-3, UP-6, UP-8, UP-10), which included work with pathogens of especially dangerous and economically significant infections. Among them are the Crimean-Congo haemorrhagic fever, leptospirosis, tick-borne encephalitis, African swine fever

The Russian MoD has commented on documents found in Ukraine regarding American instructors' data on training Ukrainian specialists in emergency response to smallpox outbreaks:

?The interest of the Pentagon in this infection is far from accidental: the return of the causative agent of smallpox will be a global catastrophe for all mankind. So, compared to COVID-19, this pathogen is just as contagious, but its lethality is 10 times higher;

?Back in 2003, the US Department of Defence developed the Smallpox Vaccination Program, according to which all US military personnel are subject to mandatory vaccination. Vaccination in the US is also mandatory for diplomatic and medical personnel. This indicates that the United States considers the causative agent of smallpox as a priority pathogenic biological agent for combat use, while these vaccination measures are aimed at protecting US military personnel;

?The lack of proper control, as well as violations of biosecurity regulations in the US, could lead to the

use of this pathogen for terrorist purposes. In the period from 2014 to 2021, unaccounted ampoules with the virus were found in laboratories of the Food and Drug Administration, the US Army Research Institute of Infectious Diseases (Maryland), and the Vaccine Research Centre (Pennsylvania). This fact constitutes a violation of World Health Assembly resolution number 49.10 of 1996, according to which the causative agent of smallpox can be stored in only one American laboratory (the Centres for Disease Control and Prevention in Atlanta);

?Smallpox vaccination, which is currently not available in many countries, provides protection against monkeypox;

?To date, 98 percent of people infected with monkeypox have been homosexual males older than 20 years old. Dr David Hermann, who previously headed the WHO's emergency department, said that the main reason for the spread of the disease is the sexual transmission of the virus;

?According to a WHO report, the spread of the West African strain of the causative agent of monkeypox originated in Nigeria, a country where the United States has placed its biological infrastructure;

?According to European and American media reports, in the materials of the Munich Security Conference in 2021, a simulated scenario to counter an outbreak caused by a new strain of the monkeypox virus was carried out;

?Amid the numerous cases of US violations of biosecurity regulations, the Russian MoD calls on the leadership of the World Health Organisation to investigate the activities of US-funded Nigerian laboratories and inform the international community about the results
