## The West's Moral Decay: Cannibalism Normalized?

### Description

via [New Scientist](#)"

**“New archaeological evidence shows that ancient humans ate each other surprisingly often – sometimes for compassionate reasons. The finds give us an opportunity to reassess our views on the practice”**

IT IS the ultimate taboo: in most societies, the idea of one human eating another is morally repugnant. Even in circumstances where it could arguably be justified, such as when a plane crashed in the Andes in 1972 and starving passengers ate the dead to survive, we still have a deep aversion to cannibalism. One of the survivors, Roberto Canessa, has since described the passengers' actions as a “descent towards our ultimate indignity”. Ethically, [cannibalism](#) poses fewer issues than you might imagine. If a body can be

bequeathed with consent to medical science, why can't it be left to feed the hungry? Our aversion has been explained in various ways. Perhaps it is down to the fact that, in Western religious traditions, bodies are seen as the seat of the soul and have a whiff of the sacred. Or maybe it is culturally ingrained, with roots in early modern colonialism, when racist stereotypes of the cannibal were concocted to justify subjugation. These came to represent the "other" to Western societies – and revulsion towards cannibalism became a tenet of their [moral conscience](#).

A slew of recent archaeological discoveries is now further complicating how we think about human cannibalism. Researchers have unearthed evidence suggesting that our hominin ancestors ate each other surprisingly often. What's more, it seems that they weren't always doing so for the reasons you might expect – for sustenance or to compete against and intimidate rivals – but often as funerary rituals to honour their dead.

Like it or not, then, cannibalism is an important part of [our story](#). This isn't to say that we should change our attitudes towards it. But understanding its deep roots might shift our perspective on the few cultures that still practise cannibalism today, albeit only occasionally, such as the Aghori, a Hindu ascetic sect in India that does it in pursuit of transcendence. Above all, these discoveries invite us to reconsider our revulsion to cannibalism in the context of our evolutionary past.

Behold the West's latest outrage—debating the undebatable and defending the indefensible. Cannibalism, once the vilest of violations, is now served up as a thought experiment for the liberal palate. It's not enlightenment; it's ethical insanity. The sanctity of human life, chewed up in the cogs of moral relativism, is spat out as a "cultural preference."

This is not a slippery slope; it's a nosedive into the abyss. The normalization of atrocities marches forward, with pedophilia disgracefully queued for a rebrand. Society's moral fabric isn't just fraying, it's being shredded by the day. Western liberalism, once a bastion of purported high values, is now an echo chamber where the deviant becomes mainstream if whispered enough times.

We must draw the line with an iron fist. The time for nuanced debate is over—this is a fight for our collective soul. We reject this mockery of human dignity, and we condemn the architects of this madness. We stand defiant, ready to reclaim our humanity and protect the most vulnerable. It's time to restore sanity, shun the shadow of relativism, and rekindle the flames of unyielding, absolute moral truth.
